

Declaration of use of Generative Artificial Intelligence (GAI)

- Latest version from June 4th, 2025

Using GAI in your projects

If you use GAI-based tools in your exam project, you must submit a declaration crediting your use of GAI when you turn in your work, according to [Aarhus University's new rules and recommendations for using GAI-based tools](#).

Please keep in mind that: You only need to submit a GAI declaration *if you actually use GAI in your exam*. And you will *not* be expected to submit a declaration in connection with on-site exams.

If you *do* use GAI tools in your exam, you must state *which* tools you use and *how* you use them in your declaration.

The reason you need to submit a declaration if you use GAI is to avoid any issues in relation to the rules on exam cheating.

You will not be graded on how you use GAI-based tools. As always, your work will only be graded on the basis of the criteria described in the the learning outcomes in the course description or academic regulations. The only reason you need to submit a declaration is to document that you have reflected on your use of GAI and have thought about how to use these tools in a relevant and legitimate way.

However, you should be aware that using GAI is integrated into the learning outcomes for certain courses. In such cases, you'll be expected to include your reflections on your use of GAI-based tools in your paper in the section on methodology. Remember to check up on this this by asking you supervisor or your lecturer.

Keep in mind:

- Always remember to familiarise yourself with applicable rules and guidelines for using GAI on the AU student website studerende.au.dk.
- You'll also find more information on your study portal.
- Never put sensitive personal information or other confidential data in a GAI tool.
- If you use a GAI tool to generate text, you must declare how you used the tool. Remember to follow the [rules for how to paraphrase correctly](#).
- If you quote directly from a text generated by GAI, you must include a citation that states which GAI tool you used – find out how to do this on the [AU Library](#) website.

How to declare your use of GAI tools

At a minimum, your GAI declaration must contain the following:

1. Confirmation that you used GAI.
2. A list of the GAI tools you used.
3. Description of how you generated the output you used, including what inputs you used to generate it, and explain how you used the output in your exam project.

To complete your declaration, fill out this form:

Declaration of use of GAI tools

☒ **I/we used generative artificial intelligence (GAI) to complete this project** (tick the box). List the GAI tool(s) you used (remember to specify version):

Gemini 2.5 Pro
Gemini Pro Preview

I/we used GAI tools in the following way (See accompanying list of possible uses for inspiration)

EXAMPLES OF LEGITIMATE USE CASES FOR GAI
--

For inspiration in formulating a thesis statement

For inspiration in relation to choice of theory and method (what models to use ect)

For feedback on own text

To understand a multimodal approaches better
--

To help with coding tasks in the main.ipynb and utils.py
--

To help when running into problems we didn't expect (dataset missing embeddings)
--

Other use case(s) (specify):

For each relevant use case, explain how you used GAI (see an explanation of the various possibilities on [Studypedia](#)). For example, if you used GAI to generate information, explain how you did this and how you used the output in your paper.

For inspiration in formulating a thesis statement – used simple prompting in Gemini to help formulate our idea. Explained our dataset and goal to Gemini, and asked for a concrete thesis statement to work from.

For inspiration in relation to choice of theory and method (what models to use ect) – used Gemini as a sparring partner, where I asked it questions such as “Would a Linear Regression model be a solid baseline model? Why and why not?” or something like “I think that our EDA needs to include a step where we focus on the distributions of our explanatory variables. How is it best to proceed with that?”

For feedback on own text – Used Gemini as a proof reading tool. I would write text, and ask it to review it. Usually in small sections at a time to avoid any confusion or information loss. I would then review its output and evaluate if I felt like its review was good enough to incorporate or not.

To understand a multimodal approaches better – Used Gemini to explain how we would eventually combine our two baseline models. I felt like getting an understanding while building our baselines would be good.

To help with coding tasks in the main.ipynb and utils.py – Asked Gemini to help generate code needed for our analysis, or review/fix code we created. Mostly the workflow was us designing what it was we wanted to do, and explaining it to the model, while asking it to generate the code needed. Then we tested the code, and reviewed it, fixing it where or if needed.

To help when running into problems we didn’t expect (dataset missing embeddings) – when we ran into unexpected problems, and didn’t want to waste time waiting for email responses, we used Gemini to come up with a plan on how best to use information from the dataset documentation to train a subset of our dataset. The idea was mostly ours, but we weren’t sure how best to implement it.
